

## STEP 4 — FUNNEL BUILDER + LEAD CAPTURE SYSTEM (GHL Funnels Clone)

This is where clients actually **generate leads** → **revenue**.

---

### STEP 4 GOAL

Create a system where:

- Users can build landing pages (funnels)
  - Capture leads via forms
  - Automatically push data into CRM
  - Trigger automation (Step 2)
  - Track conversions
- 

### 4.1 ARCHITECTURE OVERVIEW

Landing Page (Public URL)

Form Submit / Button Click

API → Perfex CRM (Create Lead)

Trigger Automation (n8n)

Store Conversion Data

---

### 4.2 DATABASE DESIGN

---

#### Table: **tbl\_funnels**

```
CREATE TABLE tbl_funnels (  
  id INT AUTO_INCREMENT PRIMARY KEY,
```

```
name VARCHAR(191),
slug VARCHAR(191),
company_id INT,
created_at DATETIME DEFAULT CURRENT_TIMESTAMP
);
```

---

### ✓ Table: **tbl\_funnel\_pages**

```
CREATE TABLE tbl_funnel_pages (
  id INT AUTO_INCREMENT PRIMARY KEY,
  funnel_id INT,
  name VARCHAR(191),
  slug VARCHAR(191),
  html LONGTEXT,
  css LONGTEXT,
  js LONGTEXT,
  page_order INT DEFAULT 0,
  created_at DATETIME DEFAULT CURRENT_TIMESTAMP
);
```

---

### ✓ Table: **tbl\_funnel\_submissions**

```
CREATE TABLE tbl_funnel_submissions (
  id INT AUTO_INCREMENT PRIMARY KEY,
  funnel_id INT,
  page_id INT,
  data JSON,
  created_at DATETIME DEFAULT CURRENT_TIMESTAMP
);
```

---

## 4.3 PUBLIC FUNNEL ROUTING

---

### ✓ URL Structure

```
https://yourcrm.com/funnel/{slug}
https://yourcrm.com/funnel/{slug}/{page}
```

---

### ✓ Controller

```
public function view($slug, $page_slug = null)
```

```
{  
    $funnel = $this->db->where('slug', $slug)->get('tbl_funnels')->row();  
  
    $this->db->where('funnel_id', $funnel->id);  
  
    if ($page_slug) {  
        $this->db->where('slug', $page_slug);  
    } else {  
        $this->db->order_by('page_order', 'ASC');  
    }  
  
    $page = $this->db->get('tbl_funnel_pages')->row();  
  
    echo $page->html;  
}
```

---

## 4.4 PAGE BUILDER (2 OPTIONS)

---

### ◆ Option A (RECOMMENDED — FAST)

Use:

- GrapesJS (drag-drop builder)
- 

#### Features:

- Drag & drop sections
  - Text editing
  - Image upload
  - Form builder
- 

#### Save Output:

```
editor.getHtml();  
editor.getCss();
```

Store in DB.

---

## ◆ Option B (Advanced)

Build your own builder (NOT recommended now)

---

## 4.5 FORM BUILDER (VERY IMPORTANT)

---

### Form Structure (HTML Example)

```
<form id="leadForm">
  <input name="name" />
  <input name="email" />
  <input name="phone" />
  <button type="submit">Submit</button>
</form>
```

---

### JS Submit

```
document.getElementById('leadForm').addEventListener('submit', function(e) {
  e.preventDefault();
```

```
  const formData = new FormData(this);
```

```
  fetch('/api/funnel-submit', {
    method: 'POST',
    body: formData
  });
});
```

---

## 4.6 BACKEND: CAPTURE LEAD

---

### Controller

```
public function funnel_submit()
{
  $data = $this->input->post();
```

```
// Save submission
$this->db->insert('tbl_funnel_submissions', [
    'funnel_id' => $data['funnel_id'],
    'page_id' => $data['page_id'],
    'data' => json_encode($data)
]);

// Create Lead in Perfex
$lead = [
    'name' => $data['name'],
    'email' => $data['email'],
    'phonenumber' => $data['phone'],
    'source' => 'funnel'
];

$this->db->insert('tblleads', $lead);
$lead_id = $this->db->insert_id();

// Trigger automation
trigger_event('lead_created', [
    'id' => $lead_id,
    'name' => $data['name'],
    'email' => $data['email'],
    'phone' => $data['phone']
]);

echo json_encode(['status' => 'success']);
}
```

---

## 4.7 MULTI-STEP FUNNELS

---

### Example:

1. Page 1 → Collect basic info
  2. Page 2 → Ask questions
  3. Page 3 → Thank you
- 

### Logic:

- Store step data in localStorage
  - Send final combined data
- 

## 4.8 CONVERSION TRACKING

---

### Track Events:

- Page view
  - Form submit
  - Button click
- 

### Table:

```
CREATE TABLE tbl_funnel_events (  
  id INT AUTO_INCREMENT PRIMARY KEY,  
  funnel_id INT,  
  page_id INT,  
  event VARCHAR(50),  
  meta JSON,  
  created_at DATETIME DEFAULT CURRENT_TIMESTAMP  
);
```

---

### JS Tracking

```
fetch('/api/track-event', {  
  method: 'POST',  
  body: JSON.stringify({  
    funnel_id: 1,  
    event: 'page_view'  
  })  
});
```

---

## 4.9 THANK YOU PAGE / REDIRECT

---

After submit:

```
window.location.href = '/funnel/thank-you';
```

---

## 4.10 DOMAIN MAPPING (ADVANCED)

---

### Example:

clientdomain.com → your funnel

---

### Approach:

- Store domain in DB
  - Use server config (Apache/Nginx)
  - Map domain → funnel\_id
- 

## 4.11 AUTOMATION CONNECTION

---

Already done:

```
trigger_event('lead_created', ...)
```

---

### Example Flow:

- Lead submits form
  - WhatsApp auto reply
  - Email sent
  - Task assigned
- 

## 4.12 TESTING CHECKLIST

---

 **Must Work:**

- Funnel page loads
  - Form submits
  - Lead created in CRM
  - Submission stored
  - Automation triggered
  - Thank you redirect works
  - Tracking events saved
- 

## STEP 4 OUTPUT

After this step:

- ✓ Funnel builder (basic/advanced)
- ✓ Lead capture system
- ✓ CRM integration
- ✓ Automation trigger
- ✓ Conversion tracking
